Irrigation
Audit
Management
and
Redesign

Bill Rogers

We are Experts on Older System Redesign

What does it mean to re-design or update an older system?

Irrigation systems installed over 20 years ago or systems that were installed poorly may need to be redesigned or upgraded to bring them up to current standards.

Sometimes we can replace parts of the system without going all in with a completely new design. We have designed existing irrigation systems with new mainline, controller and wiring components, and electric valves without replacing the lateral lines and heads.

Other times we keep the mainline and just replace the wiring and controller.

We can replace the electric valves and heads to bring the system up to a good functioning system.

Maybe the controller needs to have the controller and soil sensors upgraded to save water.

Let us do a high-level audit and evaluation of your problem irrigation systems to see if there are opportunities to bring a problem irrigation system up to a higher standard.
